

Insight 1:

Caucasian patients make up the majority of hospital admissions, accounting for the largest share across all racial groups. This may reflect demographic distribution rather than healthcare access disparities, but warrants further investigation into minority underrepresentation in diabetes care.

Insight 2:

75.79% of readmitted patients were readmitted after 30 days compared to 24.21% within 30 days. Early readmissions (within 30 days) are clinically significant as they indicate potential gaps in initial treatment quality and are costlier to manage.

Insight 3:

The average hospital stay is 4.56 days across all patients. Patients categorized as Long Stay (more than 7 days) represent a smaller proportion of cases but likely consume a disproportionate share of hospital resources, suggesting targeted intervention programs could improve efficiency.
